Security Monitoring and Vulnerability Management Report (SOC Report)

1. Executive Summary

A security monitoring environment was established and configured using the Wazuh SIEM system to successfully integrate the Kali Linux host. The work focused on setting up the connection between the agent and the manager, in addition to executing a complete process for detecting and remediating security vulnerabilities on the target system.

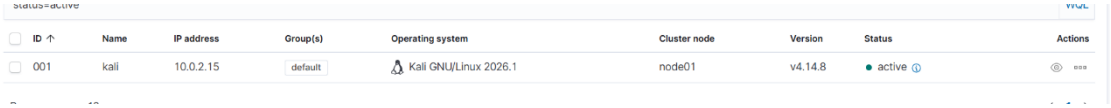

2. Environment Setup

- **Management System (Wazuh Manager):** Server named node01.
- **Monitored Agent (Wazuh Agent):** Kali Linux system with Agent ID 001.
- **Connection Status:** Active and successfully connected (Active / Connected).

3. Executed Tasks

Phase 1: Agent Integration

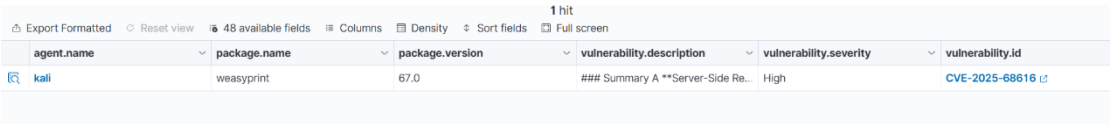

- **Operational Connection:** Installing and activating wazuh-agent on the Kali Linux system and connecting it successfully to the Wazuh Manager (node01) to collect logs and alerts.

ID ↑	Name	IP address	Group(s)	Operating system	Cluster node	Version	Status	Actions
001	kali	10.0.2.15	default	Kali GNU/Linux 2026.1	node01	v4.14.8	active	

Phase 2: Vulnerability Management & Remediation

1. **Vulnerability Scan:**
    - Engaging the Vulnerability Detection module to scan the target system (Kali Linux).
    - Analyzing the results and identifying a security vulnerability caused by an outdated software package that allows an attacker to force weasyprint to send unauthorized network requests to local servers to obtain sensitive information.

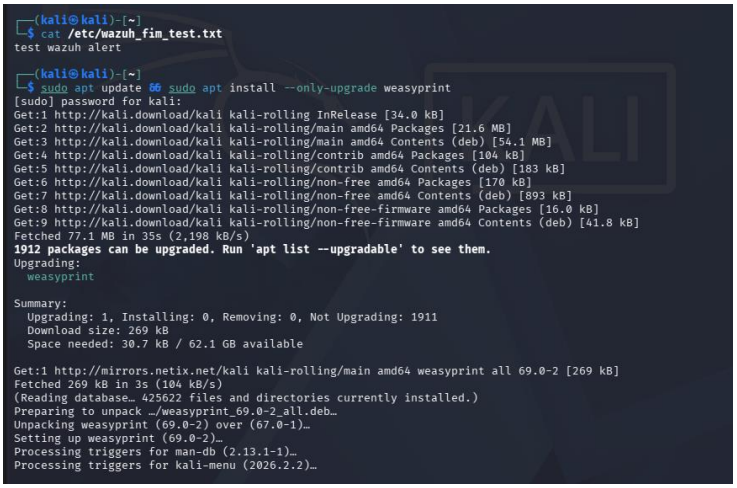

1 hit

agent.name	package.name	package.version	vulnerability.description	vulnerability.severity	vulnerability.id
kali	weasyprint	67.0	### Summary A **Server-Side Re..	High	CVE-2025-68616

2. **Remediation:**

- Applying the necessary security updates and fixes on the Kali Linux system to correct the vulnerability.

- Successfully closing the vulnerability and ensuring the hardening of the host's security posture.

4. Conclusion

The SOC security response cycle was completed with full success through:

- Ensuring stable connectivity and log flow from the agent to the main server.
- Completely detecting and remediating vulnerabilities on the host to mitigate security risks.
